

IN THE CLAIMS

Please cancel claims 1-5 without prejudice or disclaimer and add new claims 6-13 as follows:

1.-5. (Cancelled)

6. (New) A board comprising:

a guiding means at a joint between two boards, the boards comprising an upper surface and a core, said guiding means comprising groove and tenon intended to be joined with glue to form said joint, wherein at least one of the tenon and groove includes guiding wedges so that a fitting clearance between the tenon and the groove includes a first fitting clearance and a second, guiding fitting clearance is obtained through the guiding wedges, whereby the first fitting clearance comprises a main part of a fit between the groove and tenon and the second, guiding fitting clearance comprises a smaller part of the fit and wherein the first fitting clearance is in the range of 0.1-1 mm, while the second, guiding fitting clearance is in the range of 0.01-0.2 mm, provided that the first fitting clearance is larger than the second fitting clearance, and

a planar surface,

wherein the guiding wedges comprise a distal tapered section and a proximal section extending from the tapered section to the core, and the planar surface of said board abuts a planar surface of an adjacent board when the tenon of said board is mated with a groove of the adjacent board.

7. (New) A board according to claim 6, wherein the surfaces of a joint formed by the connection between the groove and tenon are provided with recesses so that cavities are formed in the joint, which cavities are intended to receive the glue used during the joining.

8. (New) A board according to claim 6, wherein the guiding means forms a part of boards intended to, when joined together with similar boards, form a floor, whereby the boards have a core, the core of the boards being constituted by a fibre board or a particle board and that at least the upper side of the board is constituted by a decorative thermosetting laminate.

9. (New) A board according to claim 7, wherein the surfaces of a joint formed by the connection between the groove and tenon are provided with recesses so that cavities are formed in the joint, which cavities are intended to receive the glue used during the joining.

10. (New) A board according to claim 6, wherein the guiding means forms a part of boards, intended to, together form a floor, whereby the boards have a core being constituted by a fibre board or a particle board.

11. (New) A board according to claim 7, wherein the guiding means forms a part of boards intended to, when joined together with similar boards, form a floor, whereby the boards have a core of the boards being constituted by a fibre board or a particle board and that at least the upper side of the board is constituted by a decorative thermosetting laminate

12. (New) A board according to claim 6, wherein the second guiding fitting clearance is proximate the board with respect to the first fitting clearance.

13. (New) A board according to claim 6, wherein the guiding wedges are arranged perpendicular to the extension of the joint.
